PROFESSIONAL DOCUMENT SOLUTIONS SINCE 1949

## Sepialine Argos

Built by Architects  
for Architects

Print management designed with your needs  
in mind.

Argos was developed by architects who were unhappy with the cost recovery options available to their market. Most cost recovery solutions understand small format printing, but large format is a different world. Argos started by tackling the complex stuff first — plotters, batching, HDI drivers, plot submission tools, 3D modelers, and then circled back to finish up with the basics. The end result is the most comprehensive and advanced solution available to the AEC market.

### **Turn your prints into profits**

Argos tracks every print, scan and copy to all of your devices. Even manual work like binding, stapling and collating can be allocated to a project. Use Argos to pass printing costs onto your projects with simplified reporting and accounting integration.

### **Round-trip accounting integration makes billing a breeze**

Argos integrates with the most common, and some of the most esoteric, AEC accounting packages out there. Ensure your project list is always synced so users bill their prints to valid projects, and automatically export the data back to run seamless invoices directly from your accounting package. Works with Deltek Vision, Axium Ajera, and countless others.

### **Track and manage printing costs effectively**

Any way you look at it, printing costs money. It is a challenge to manage staff productivity while reining in printing costs. Argos helps you manage your device fleet in a cost-effective way□
